

Advanced WiFi Capture

How to Improve WiFi Reception in the Mobile Environment

Jack Mayer
jackdanmayer.com

Why Use WiFi?

- You need multiple sources for Internet when travelling
- Cellular and WiFi together give you good access
- Many RV parks and stores have decent WiFi – if it is available, you want to use it

Cellular Router

The *Heart* of Your Network

- A “regular” router, expanded to use Cellular AND/OR WiFi as the backhaul to the Internet

Jack Mayer - HDT Rally, 2015

Terminology/Acronyms

- **CPE** – Customer Premise Equipment
- **Backhaul** – The connection to the Internet
- **WiFi “Hotspot”, AP (Access Point)** – a radio device broadcasting a WiFi signal that connects you to the Internet
- **WISP** – Wireless Internet Service Provider
- **WiFi as WAN** – in a router, use of a wifi hotspot for backhaul; not physically tethered
- **Tethered** – physically connecting a cellular “Jetpack” to your router with a USB cord (typically)
- **WFR** – WiFiRanger product (generic term)
- **Cellular Router** – a router that supports a cellular modem as a source of backhaul
- **POE** – “Power over Ethernet”

Issues With WiFi Connections

The issues are simple – the solutions are complex.....

- Line of sight (LOS) – this is the biggest issue
 - Other RVs
 - Trees
 - Hills
- Metal/Water
 - Your RV skin
 - Other RVs
 - Wet leaves
- Distance

The Solutions

Attributes that Maximize WiFi Signal Capture

- Issue: Line of Sight
 - Solution 1: Antenna on your roof
 - Solution 2: Better radio
- Issue: Signal is blocked – Metal or Water
 - Solution 1: Get above it
 - Solution 2: Blast through it
- Issue: Distance
 - Solution 1: Antennas – External antenna, directional antenna
 - Solution 2: Better radio

Solutions boil down to better radios, and better antenna technology positioned high for best Line of Sight.

Methods of Signal Improvement

- With your laptop
 - A better radio set – get a superior external wifi adaptor
 - Issues: USB, height limits, power antenna limitations
- Utilizing *WiFi as WAN* router
 - A better antenna – MIMO, external
 - More power – a better transmitter
 - Antenna positioning – put it higher
- A CPE

Methods of Signal Improvement

Jack Mayer - HDT Rally, 2015

What's a CPE ?

... and Why Would I Want One

- “***Customer Premise Equipment***” - a separate WiFi radio and Antenna
- The CPE captures a wifi signal and communicates with your router (or computer), typically via Ethernet
- A CPE addresses all of the issues associated with WiFi signal capture
 - Can be positioned on the roof
 - Has an advanced antenna
 - Has a superior radio (receive and transmit sensitivity) with higher power

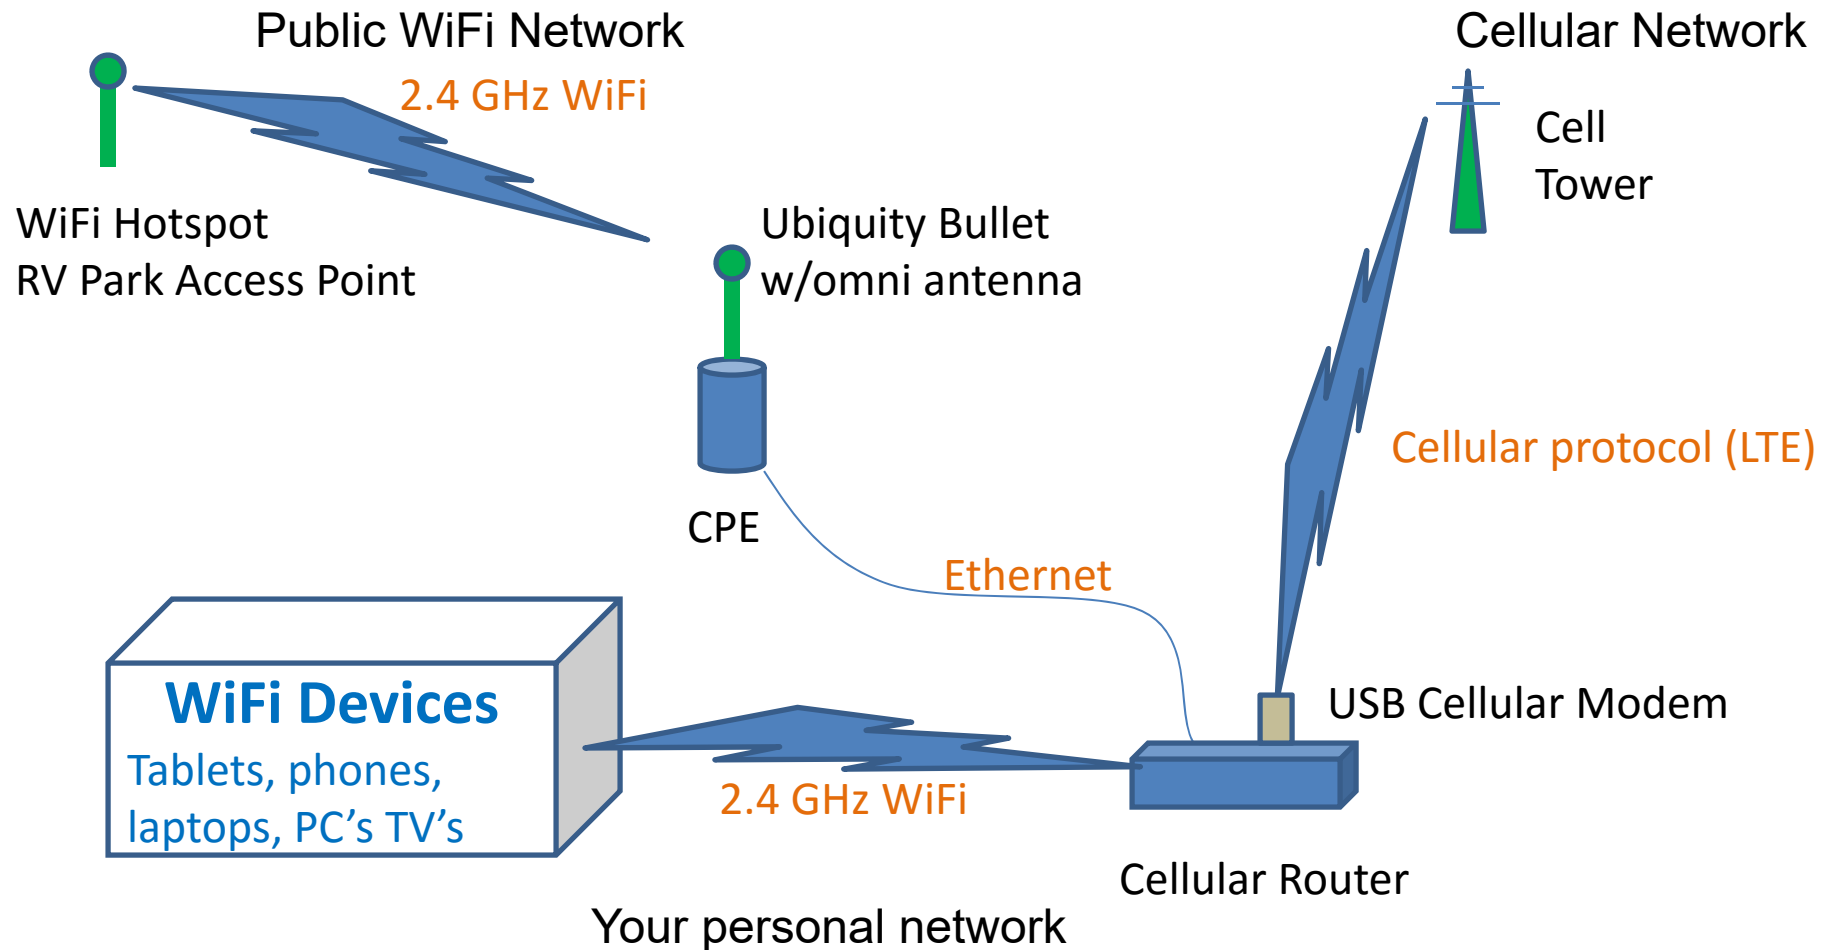

What's a CPE ?

Examples Utilizing a Ubiquiti Bullet

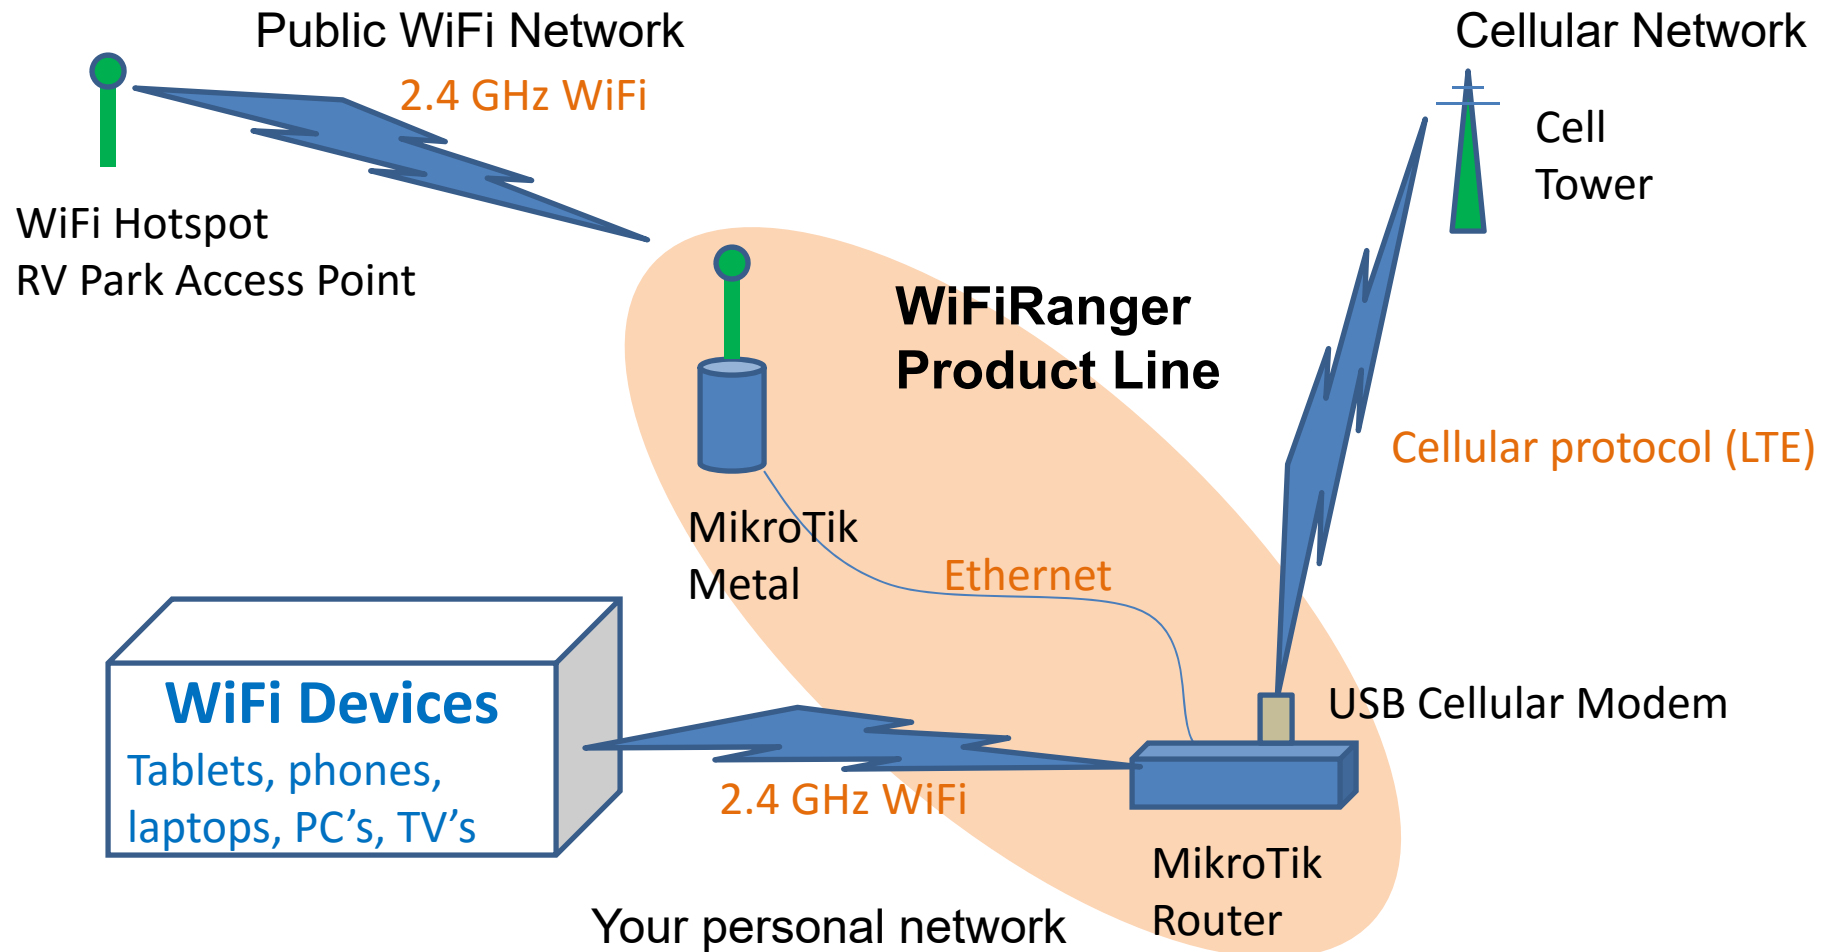

The Complete System

Your **Best** Chance at Getting Internet

The Complete System

Your **Best** Chance at Getting Internet

Antennas

- Directional
 - Focuses energy in a narrow band – around 30 degrees (typically)
 - Must be pointed at signal source
 - Typically not ideal for Rvers
- Omnidirection
 - 360*
 - Requires no pointing
 - Not as much gain/performance
 - ...but ideal for Rvers

Cellular Routers

What Attributes Do You Look For?

- Reliability
- Ease of Configuration and Management
- Completeness
- Signal Range
- WiFi As WAN
- LAN ports for physical connection
- Cellular Modem Support
- Works with a CPE, or has add-on CPE
- Support

Technology Solutions

Categories of solutions

- WiFiRanger product family: Elite, Sky, Go2 Router
 - “Best in Class” solution
 - Lots of capability and range
- Rouge Wave
 - Range is similar to WiFiRanger, but less capabilities/features
 - Simpler to use than WFR
- Homebuilt Solutions
 - Typically built around a Ubiquity CPE paired with a Cellular router.
- USB adaptors, Pepwave CPE’s and other “in RV” solutions
 - Can enhance performance but not to the extent of externally mounted solutions
 - Good if you can see the Access Point from your RV Window

Building Your Own

MikroTik vs. Ubiquity

- Both build high performance products that are inexpensive
- Both are oriented towards Networking professionals.
- Notice that the WFR products were originally based on Ubiquity but are now all MikroTic-based.
- There is more “available” experience with Ubiquity products. More YouTube, more independent “Guides”, and the products are easier for a novice to work with.

Bottom line: For the professional use MikroTik. All others should use Ubiquity.

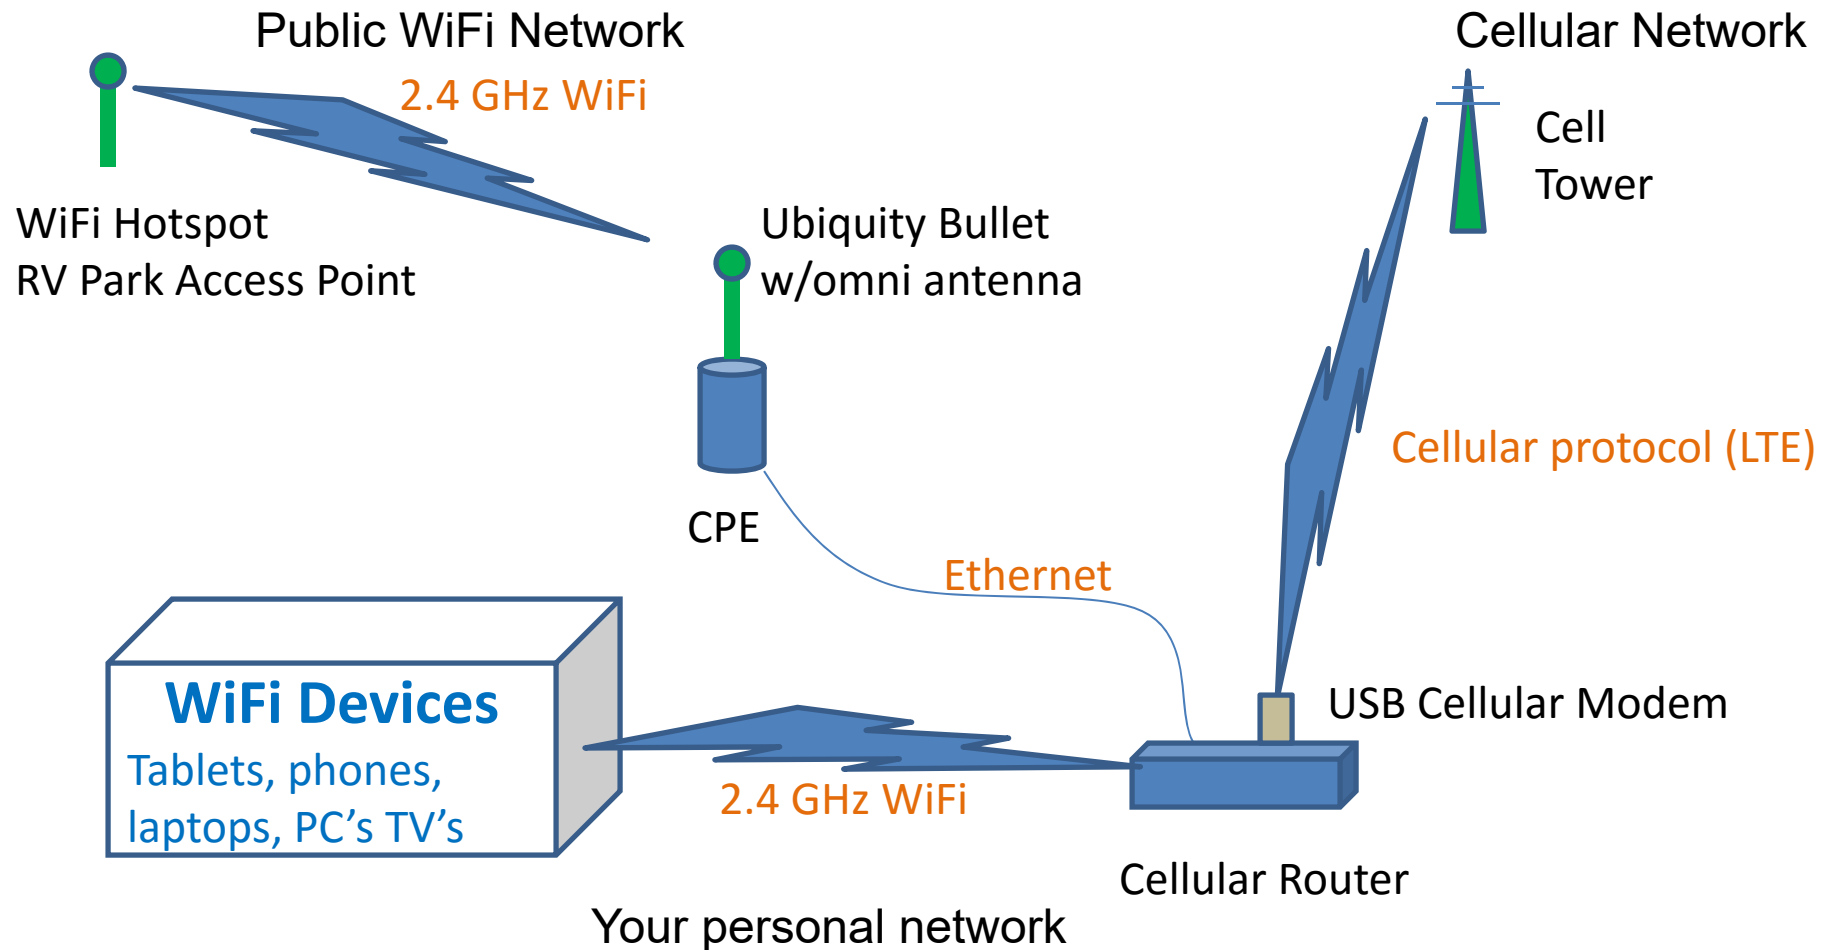

OK – This is totally Confusing

Just Tell me what I should do....

- If you need the BEST solution for the least work (and most money)
 - WiFiRanger Family
- For a DIY Solution
 - Ubiquity Picostation with Pepwave Cellular Router
- For Less Flexibility but less complexity and cost
 - Rouge Wave with any router (non cellular solution)
